Twenty loop lines

Each loop is a line that comes back to where it starts.

This map draws the 20 numbered loops: 25 variables and 46 connections. The register lists all 51 variables and 118 connections.

Sketched loops, with no numbered chain and so no stations: B2, automatic benefits cushion economic shocks; B3, new competitors can limit market power; R9, taking part in a successful repair may support the next one.

HOW TO READ IT

- Documented or well supported
- Contested
- Plausible
- Hypothesis
- (+) Both move the same way
- (−) They move opposite ways

Each tag points the way its step runs.

- A variable on one loop
- Shared by several loops
- R: feeds itself.
- B: pushes back.

Stations sit on an even grid. Distance and line length carry no meaning.
